Education

International Institute of Information Technology - IIITH

Bachelor Of Technology in Computer Science Engineering (GPA: 7.58)

2022 - 2026

Hyderabad, Telangana

Technical Skills

Programming Languages and Core: Python, Java, C, C++, SQL, TypeScript, OOPs

Systems & Distributed Computing: Operating Systems (Linux), Computer Networks, Docker, K8s, gRPC, WebRTC

AI/ML: PyTorch, TensorFlow, Scikit-learn, Natural Language Processing, LangChain, RAG, MCP

DevOps & Cloud: Google Cloud Platform (GCP), Firebase, Terraform, Ansible, Jenkins, Grafana, Prometheus, Sonarqube

Web, App Dev & Databases: React, Node, Express, Flask, React Native, MySQL, MongoDB, Redis

Experience

Software Developer | AT&T

Mar – Jun 2024

- Developed a secure EHR (Electronic Health Record) sharing system replacing email-based exchange, enabling hospitals to access patient data through a centralized FHIR-compliant server. Implemented Hash ID-based identity protection and consent-driven data retrieval, improving security and data accessibility by 30%.
- Built the backend infrastructure, a responsive web interface, and a React Native mobile app for patient consent management, ensuring seamless multi-platform interoperability.

Software Developer | VP Innovations

Jan – Feb 2024

- Built a cross-platform health monitoring app integrating Google Fit & Samsung Health via Health Connect APIs, enabling real-time wearable data sync using Firebase. Implemented a Python-based Naive Bayes model to deliver personalized activity insights, improving recommendation accuracy by 15%.

Projects

Online Peer-to-Peer Meeting Platform | MERN, Docker, WebRTC, Firebase

- Developed a scalable P2P meeting platform supporting real-time audio/video streaming for 10,000+ concurrent users using a microservices-based architecture.
- Containerized services with Docker and leveraged Firebase for real-time signaling/authentication, achieving 99.95% availability and 25% lower latency under high concurrency.

Network File System | C, System Calls, Networking, OS, Concurrency

- Designed a distributed Network File System with naming, storage, and client servers; implemented file operations over TCP/UDP with thread-safe concurrency control. Added data replication and reliability mechanisms, improving transfer consistency by 30% while applying OS-level concepts using threads, sockets, and system calls.

RSS Reader: System Redesign and Feature Enhancement | Java, Spring Boot, OOP, Jenkins, SonarQube

- Refactored and modularized a legacy RSS Reader system by resolving 20+ design smells using SonarQube and UML-based architecture review, improving code quality by 15%.
- Added modules for user registration, bug reporting, and AI-based feed summaries; automated design smell detection and CI/CD using LLM-driven refactoring and Jenkins pipelines.

PolyMind AI: Multi-Agent Reasoning System | Python, MCPs, LLMs

- Built a terminal-based multi-agent system with specialized Coding, Math, and General agents powered by dedicated MCP tools (code execution, math engine, web scraping, context-aware search).
- Implemented a structured reasoning pipeline with pre-query processing and post-response formatting, enabling autonomous tool invocation and consistently high-quality outputs.

SimpleRA: A Minimalist Integer-Only RDBMS | C++, SQL, CMake

- Built a minimalist SQL engine with a custom parser, query executor (SELECT, INSERT, UPDATE), and B+ tree indexing layer. Optimized buffer management and page layout, achieving 60% faster query execution compared to a naive baseline.

Technical Involvement & Interests

- Participated in national-level hackathons and explored open-source projects to study real-world architectures.
- Follow technical blogs and Medium articles on AI, system design, and emerging open-source technologies.
